

3rd Week

Portuguese Real Estate Intelligence: Strategic Analysis of Valuation Hegemony and the Asset Integrity Transition

The real estate sector in Portugal has entered a phase of structural transformation, shifting from an era of information scarcity and transactional opacity to a sophisticated, data-driven ecosystem.¹ Historically, the market was characterized by a lack of "navigation indicators," forcing practitioners to rely on localized trust networks rather than empirical evidence.¹ This paradigm began to shift in 1988 with the founding of Confidencial Imobiliário (Ci), which eventually established the Residential Information System (SIR), a databank that currently anchors the overwhelming majority of institutional property valuations in the country.¹ As of 2026, the Portuguese property market is one of the most dynamic yet complex in the European Union, with median residential prices reaching high benchmarks and yields compressing under the weight of sustained international demand.⁶

The emergence of two critical regulatory catalysts—the 2024 Simplex Urbanístico (Decree-Law 10/2024) and the Energy Performance of Buildings Directive (EPBD)—has created a significant intelligence gap that traditional macro-transactional models are not engineered to fill.⁹ This report provides a comprehensive analysis of the existing valuation infrastructure dominated by Ci, identifies the strategic vulnerabilities of current models, and outlines the necessity for a new tier of ground-truth intelligence powered by InspectOS. By integrating predictive sourcing, enhanced physical due diligence, and adaptive cost-adjusted valuations, a new architecture for Portuguese PropTech is established, positioning first-movers to capture the "Blue Ocean" of asset integrity analytics.¹³

CM Valuation Model – Strategic Gaps and Opportunities

Confidencial Imobiliário (Ci) operates as the primary provider of market intelligence indicators, indices, and exclusive databases on the Portuguese housing market.¹⁴ Its dominance is founded on a closed-loop data acquisition strategy that incentivizes transparency among professional operators.¹ By providing real transaction data, Ci has become the "gold standard" for credit institutions, authorities like the Banco de Portugal, the European Central Bank (ECB), and the Bank for International Settlements (BIS).¹

Structure and Methodology of Confidencial Imobiliário

The core of Ci's capability is the Residential Information System (SIR), which monitors properties from the point of market entry to the final closing of the transaction.¹ This comprehensive lifecycle tracking allows Ci to generate unique indicators such as "absorption time," "negotiation spreads," and the "GAP market value"—the differential between asking prices and actual closing values.¹

The technical architecture of the SIR platform is built upon a robust stack including Django, Postgres, and Postgis, which enables the management of over 150 tables and 10 million records.² Data is processed through a three-stage pipeline:

- 1. **SIR Factory:** Ingests raw transactional and listing data into a centralized data-cube.²
- 2. **Expert Data Science:** A specialized team of data scientists applies statistical models to generate market dynamics.²
- 3. **Visualization Layer:** Delivers statistics through customizable tables, graphs, and cartograms.²

Segment	Data Focus	Customers
Housing Assets	Real transaction prices, price dynamics 5	Banks, Funds, Institutional Investors 15
Urban Rehabilitation	Costs and prices in ARU (Rehabilitation) zones 15	Developers, Municipalities 15
Rental Market	Contracted rents, lease durations 2	Large-scale landlords, REITs 19
Short-Term Rental	RNAL registries, tourism demand 15	Investors, Yield-seekers 15
Resorts	Specific pricing for luxury and tourist developments 5	High-Net-Worth Individuals (HNWIs) 7

Why Institutional Valuations Rely on CM

Ci dominates an estimated 90% of the institutional valuation market because it effectively manages the "Trust Asset".¹ In an opaque market, trust is the most difficult asset to build.¹ Professional operators—including over 600 real estate agents, credit institutions, developers, and investors—provide Ci with their proprietary transaction figures because the aggregate data they receive in return is essential for their commercial and investment processes.¹ This creates a high switching cost and a significant barrier to entry for competitors who lack a legacy transaction database.¹

Furthermore, Ci's Index Ci is the most referenced house price index in Portugal, providing a benchmark that is essential for mortgage risk management and portfolio revaluation.⁴ The alignment with European Banking Authority (EBA) regulations and the rigorous confidentiality protocols (using 7-digit postcode aggregation to preserve privacy) make it the only platform that satisfies the compliance requirements of major credit institutions.¹

Strategic Weaknesses and Limitations

Despite its institutional strength, the CM model possesses structural weaknesses that create significant opportunities for adaptive PropTech platforms. The primary limitation of the SIR system is its physical blindness.²¹ Ci's models are primarily econometric; they analyze property value as a function of location, typology, and "average" condition proxies.²²

The model lacks:

- **Physical Defect Granularity:** It cannot account for "invisible" issues like structural moisture, aging electrical systems, or plumbing decay.²⁵
- **ESG and Retrofit Intelligence:** It does not quantify the specific CAPEX required to transition a building from an EPC rating of F to an A, which is becoming a mandatory requirement under the EPBD.⁹
- **Regulatory Liability Modeling:** It provides limited analysis of the legal risks associated with the Simplex Urbanístico, such as the potential for illegal modifications that are no longer verified by notaries.²⁹
- **Consumer/Individual Focus:** The platform is predominantly B2B and institutional, leaving a massive gap for individual investors who require granular, property-specific advice.¹³

These gaps indicate that while CM is excellent at defining what a property "should" be worth based on macro-sentiment, it cannot tell an investor what a specific property is "actually" worth based on its physical and legal integrity.¹

Connecting Macro-Transactional Data to Physical Ground-Truth

The supervisor's mandate to move "full force on InspectOS" represents a strategic pivot toward creating a new "Truth Layer" in the Portuguese market.³⁵ This transition requires a synthesis of macro-econometric data (CM) with physical-environmental ground-truth data (InspectOS).¹

Transforming Proxies into Quantified Variables

Traditional valuation models, including the SIR, rely on "Age" or "Conservation Status" as proxy variables.²³ These are often subjective or outdated.²³ InspectOS replaces these proxies with hard data points derived from professional on-site assessments and automated compliance monitoring.³⁵

Macro Proxy (CM)	Ground-Truth Variable (InspectOS)	Impact on Valuation Accuracy
Year Built	Structural integrity score / remaining lifecycle of systems ²⁵	Adjusts for deferred maintenance and immediate CAPEX needs. ²⁸
EPC Rating (Static)	Quantified energy upgrade cost model (EPBD Alignment) ⁹	Corrects the "Brown Discount" based on real renovation ROI. ²⁷
Location Index	Micro-neighborhood distress signals (Boletim Municipal) ³⁷	Predicts neighborhood transition and coercive maintenance risk. ³⁷
Market Average Condition	Real defect data (Moisture, Seismic risk, Asbestos) ¹³	Identifies "Value-at-Risk" (VaR) for individual assets. ³³

By embedding these variables into a dynamic valuation model, InspectOS allows for the calculation of an "Asset Integrity Correction Factor" (AICF). This factor mathematically adjusts the SIR baseline value to reflect the true cost of ownership and regulatory compliance.²⁷

The ESG Catalyst: Pricing the Green Transition

Portugal faces a unique challenge in its energy transition: over 85% of its building stock was constructed before 2000, and many buildings lack modern insulation or sustainable heating solutions.⁹ The EPBD 2026 update introduces mandatory Minimum Energy Performance Standards (MEPS).⁹

Research indicates that energy efficiency is becoming a "price multiplier" rather than just an operational detail.¹² Properties with an A/A+ rating command premiums of 10-15% and benefit from preferential interest rates (0.1-0.3% reduction) from Portuguese banks.²⁸ Conversely, inefficient buildings face a "Brown Discount" of 10-30% and the risk of becoming "stranded assets".²⁷

Energy Rating	Typical Annual Energy Cost (3-bed villa)	Valuation Sentiment
A+ / A	€600 - €900 ²⁸	"Green Premium": Highly liquid, easy to finance. ²⁸
B / C	€1,200 - €2,400 ²⁸	Market Neutral: Requires moderate maintenance focus. ²⁸
D / E	€2,400 - €4,000 ²⁸	Emerging Discount: Investors start factoring in upgrade costs. ²⁷
F / G	€5,000+ ²⁸	"Brown Discount": High risk of liquidity issues and mandatory CAPEX. ²⁷

InspectOS fills the gap by providing a structural-digital twin of the property's energy profile.²⁸ It does not just state the rating; it calculates the ROI of specific interventions—such as solar PV installation (5-10 year payback) or wall insulation—allowing the investor to value the property based on its "future-proofed" state.²⁸

The Regulatory Paradigm Shift: Simplex Urbanístico 2.0

The publication of Decree-Law No. 10/2024 represents the most significant reform of urban licensing in Portugal in decades.¹⁰ The "Zero Licensing" philosophy aims to increase the supply of housing by slashing bureaucracy, but it has simultaneously fundamentally altered the risk landscape for buyers and technical professionals.³¹

Revocation of Municipal Control

The most controversial measure of the Simplex is the end of the mandatory requirement to present a *licença de utilização* (usage permit) or a *ficha técnica da habitação* (housing technical sheet) at the time of signing the deed of sale.¹¹

Previously, the notary served as a de facto compliance officer, ensuring that the property matched its legal description.³⁰

Under the new regime:

- **Liability Shifts to the Buyer:** It is now up to the buyer to verify the legality of the construction.³¹ Purchasing a house without an independent technical assessment now carries the risk of inheriting illegal works, which can lead to fines, demolition orders, or the inability to obtain mortgage financing.²⁹
- **Tacit Approval Risks:** Many projects now benefit from "tacit approval" if the municipality fails to respond within 120-200 days.⁴⁹ While this speeds up construction, it means that many properties enter the market without ever having been explicitly reviewed by a public entity for technical safety or zoning compliance.²⁹
- **Professional Responsibility:** Architects and engineers now serve as the legal guarantors of work through "terms of responsibility".¹⁰ This increases their personal and professional liability, creating a massive need for system-of-record tools like InspectOS to document and manage their assessments.¹⁰

The PEPU Pivot: Centralized Municipal Monitoring

Starting January 5, 2026, the Electronic Platform for Urban Planning Procedures (PEPU) will become mandatory for all 308 municipalities.¹⁰ This platform represents a pivotal moment for PropTech data engineering.⁵⁴ For the first time, all permit applications, process statuses, and construction deadlines will be accessible through a single, digital "One Stop Shop".⁵⁴

Fairbank Intel and InspectOS can leverage the PEPU API to track:

- **Neighborhood Pipeline Density:** Identifying areas where a surge in "prior notifications" (interventions exempt from full licensing) signals rapid gentrification.¹¹
- **Construction Delays:** Monitoring municipalities that consistently miss the 120-200 day windows, leading to a high volume of "tacit approval" properties.⁴⁹

- **Urban Title Verification:** Programmatically confirming whether a property being sold off-market possesses the necessary "Urban Title" required for legal transaction.⁵⁷

Predictive Off-Market Sourcing: Mining the signals of Distress

The ability to source off-market deals is the primary differentiator for high-alpha investors in the Portuguese market.⁵⁹ Predictive sourcing relies on the systematic identification of "distress signals"—multi-layered indicators that a property owner is motivated or legally compelled to sell.¹⁰

Municipal Coercive Works and "Devolutos"

Lisbon alone is estimated to have approximately 48,000 vacant or abandoned housing units.³⁷ The "Mais Habitação" package and recent municipal charter updates have significantly intensified the fiscal penalties for these properties.³⁷

Distress Indicator	Regulatory Mechanism	Predictive Signal
IMI 6x - 12x Increase	Buildings vacant for >2 years in Urban Pressure Zones (ZPU) ³⁷	Identification of properties with high "Tax Burden Growth," signaling a forced sale or rehabilitation. ³⁷
Obras Coercivas	Municipal takeover of repairs for buildings in ruin (Art. 107-108 RJUE) ⁴⁰	Appearance on the <i>Boletim Municipal</i> list of coercive interventions; the owner must reimburse the city. ³⁸
Low Utility Consumption	Electricity < 35 kWh/year or Water < 7 m3/year ⁶⁸	Data-sharing mandate between utility companies and councils to classify properties as "devoluto". ⁶⁴
Herança Indivisa	Properties in probate for years with multiple heirs ⁷⁴	Persistent appearance in the Land Registry (<i>Conservatória</i>) without a clear single title-holder. ⁷⁴

Monitoring these signals allows Fairbank Intel to create a "Pre-Distress Inventory".³⁷ By the time these properties hit the secondary market on platforms like Idealista, their value has often already re-rated.⁵⁹ Predictive sourcing captures the delta between current neglected value and future rehabilitated value.¹⁷

Condominium Arrears and Reserve Fund Health

A critical yet opaque distress signal is the state of the building's reserve fund (*fundo comum de reserva*) and individual unit arrears.⁷⁶ Since April 2022, Law No. 8/2022 mandates that sellers must provide a declaration from the condominium administrator confirming the absence of debt.⁷⁶

Investors who integrate "Condo Health Scoring" into their due diligence can identify buildings that are on the verge of massive extraordinary work levies.⁷⁶ This information is found in the "minutes of the assembly" (atas), which often detail structural defects or planned upgrades years before they are executed.⁷⁹ Properties with high unit arrears often belong to absentee owners or distressed heirs, providing a prime channel for off-market negotiation.⁷⁴

Reflecting on the Strategic Architecture Thinking

The strategic triad of predictive sourcing, better valuations, and enhanced due diligence forms a unified intelligence flywheel. The goal is not merely to perform three separate tasks, but to create a single, trust-based system that eliminates information asymmetry.¹

How Inspection Data Improves Valuation

Traditional AVMs are "condition-blind".²¹ They assume a property is a standard unit in a standard building.²¹ InspectOS data changes the fundamental math of valuation.³⁵ If a property in the SIR database is valued at €5,000/m², but InspectOS identifies a structural moisture defect and a G-rated energy profile requiring €40,000 in immediate CAPEX, the "investment-grade" valuation is immediately revised downward.²⁷ This prevents investors from overpaying and allows for "bid-shaving" based on objective technical evidence.²⁶

How Valuation Improves Predictive Sourcing

Understanding the "gap" between different valuation models allows for the identification of undervalued assets.¹ For example, when the *Valor Patrimonial Tributário* (VPT) is significantly lower than the market value, the property is a "tax haven" for the owner.⁶² However, when the VPT is updated and the owner is hit with the 6x IMI penalty for vacancy, the

financial pressure creates a "forced exit" window.³⁷ Predictive sourcing algorithms monitor these "tax-step" events to target owners whose holding costs have suddenly become unsustainable.⁶²

How Sourcing Improves Off-Market Success

Off-market success is a function of "Immediacy and Proof".⁵⁹ When Fairbank Intel identifies a distressed signal (e.g., an *obra coerciva* listing in Odivelas), it can approach the owner with a "Certified Pre-Valuation".³⁸ This valuation is not just an offer; it is a data-backed report showing the SIR market baseline, the quantified physical defects, and the regulatory upgrade requirements.¹ This level of transparency reduces the negotiation friction often found in private sales where sellers have "distorted perceptions" of their property's worth.¹

Strategy Component	Operational Mechanism	Value Creation
Predictive Sourcing	Monitoring tax arrears, IMI penalties, and coercive work bulletins. ³⁸	Identifies motivated sellers before market entry. ³⁷
Better Valuation	Applying InspectOS physical scores and EPC upgrade cost corrections. ²⁷	Defines the "True Net Value" of the asset. ²⁷
Due Diligence	Independent verification of "Urban Titles" and physical reality vs. legal records. ³¹	Mitigates the "Buyer Liability Trap" of Simplex 2.0. ²⁹

Identifying One Strategic Suggestion: The AIRCS

The primary strategic suggestion for Fairbank Intel and InspectOS is the creation and dominance of the **Asset Integrity & Regulatory Compliance Score (AIRCS)**.

Concept: The "Credit Score" for Buildings

In a market where municipal licensing has retreated, the AIRCS serves as the private-sector replacement for the "Usage Permit".³¹ It is a single, quantified metric that represents the probability of a positive investment outcome for a specific asset.²⁰

The AIRCS is composed of:

1. **Transactional Health (40%):** Derived from SIR/Ci data, comparing the property to the postcode-level transaction baseline and recent net yields.¹⁵
2. **Physical Integrity (30%):** Derived from InspectOS professional assessments of the building envelope, technical systems, and moisture profile.²⁶
3. **Regulatory Compliance (20%):** A "Simplex-Audit" verifying the presence of an "Urban Title" and identifying any unauthorized construction work that could block future financing.³¹
4. **Energy Resilience (10%):** A quantified CAPEX model for achieving 2030 EPBD standards, providing a "Green Horizon" rating.⁹

Positioning as the "Verified Buyer/Seller Score"

The AIRCS should be positioned as a bidirectional trust tool:

- **For the Seller:** A "High-AIRCS" property can be marketed with a premium.⁴⁴ It signals to international cash buyers that the asset is "Institutional Grade," free from legal nightmares, and has been technically "vetted" by InspectOS.³¹
- **For the Buyer:** It serves as the ultimate pre-due-diligence filter.⁸⁵ Instead of spending weeks on lawyers and engineers for 10 different properties, a buyer can filter for "AIRCS > 80" assets, drastically reducing their cost-per-acquisition.²⁵
- **For the Bank:** The AIRCS API can be licensed to credit institutions.¹⁹ As banks face increasing pressure to monitor the ESG and physical risk of their mortgage portfolios, the AIRCS provides a "risk-weighting" indicator that far exceeds the capability of a standard appraisal.²⁰

By making the AIRCS the "System of Record" for property health in Portugal, Fairbank Intel creates a compounding data moat.¹³ Every inspection performed by a professional using the InspectOS app adds a granular data point to the model, reinforcing its accuracy and making it an indispensable infrastructure for the entire Iberian real estate ecosystem.³⁶

Technical Implementation Blueprint

To build the AIRCS and the predictive sourcing engine, the platform must unify diverse and fragmented government datasets with proprietary physical inputs.⁸

Data Ingestion and Lakehouse Architecture

The recommended technical stack leverages a medallion lakehouse architecture (Bronze/Silver/Gold) to ensure data lineage and GDPR compliance.⁵

Pipeline Stage	Priority Datasets	Normalization Requirement
Bronze (Raw)	Idealista/Imovirtual API feeds, INE Transaction stats, Sentinel-2 imagery. ²	Ingestion of raw municipal bulletins from 308 sources via custom NLP scrapers. ¹⁰
Silver (Cleansed)	Standardized 7-digit postcode matching with CAOP boundaries. ¹	Deduplication of duplicate listings using computer vision and image hashing. ³⁶
Gold (Intelligence)	Proprietary physical condition scores from InspectOS workflows. ³⁶	Calculation of AIRCS scores and the EPC "Brown-to-Green" ROI models. ²⁷

Managing the Information Asymmetry for Foreign Buyers

Foreign buyers, particularly HNWIs from North America and Northern Europe, currently represent a significant portion of high-value transactions in Lisbon and the Algarve.⁷ These buyers face the greatest information asymmetry due to language barriers, bureaucratic complexity, and the sudden shift in liability under the Simplex laws.³¹

The platform must deliver:

- **English-Language Transparency:** Translating technical *boletins municipais* and *certidões permanentes* into actionable investor briefings.¹
- **Demonstrable Capability:** Providing "45 public tools" (tax calculators, yield simulators, etc.) to establish trust before asking for business.¹
- **Retainer-plus-Success Model:** Combining the high-tech AIRCS score with high-touch human advisory for the final closing and deed verification.³¹

The integration of Confidencial Imobiliário's macro-transactional data with the physical ground-truth of InspectOS represents the next frontier of PropTech in Portugal.¹ In a market where regulatory safety nets have been removed, the platform that provides the definitive "Asset Integrity Score" will become the foundational infrastructure for the entire sector.³¹ By focusing on predictive sourcing of distressed assets and quantifying the green transition, Fairbank Intel is positioned to solve the most critical challenges facing risk-aware investors in the 2026 landscape.⁹

Week 3 – Portuguese Real Estate Intelligence

Strategic Shift: From Price Data → Asset Truth

1 Market Context – What Changed?

Portugal moved from:

- ✗ Information scarcity
- ✗ Relationship-based pricing
- ✗ Opaque transactions

To:

- ✓ Data-driven valuations
- ✓ Institutional transaction databases
- ✓ Professionalized pricing models

The turning point was **1988**, when **Confidencial Imobiliário (Ci)** created the **SIR (Residential Information System)**.

Today:

- 📊 ~90% of institutional valuations rely on SIR
- 🏠 Banks use Ci for mortgage risk

- 🇪🇺 Regulators trust it

But something changed in 2024–2026...

2 The Big Shock: New Regulations Created a Gap

Two major regulatory catalysts:

🏛️ 1. Simplex Urbanístico (Decree-Law 10/2024)

Before:

- Notaries checked usage permits
- Municipality verified legality

Now:

- ⚠️ Buyer is responsible for verifying legality
- ⚠️ Tacit approvals allowed (no explicit review)
- ⚠️ Illegal works may transfer to new owner

👉 This increases **legal and financial risk** for buyers.

🌱 2. EPBD (Energy Performance of Buildings Directive)

Europe now requires:

- Minimum Energy Performance Standards (MEPS)
- Energy upgrades for inefficient buildings

Impact:

Rating	Effect
🟢 A / A+	+10–15% price premium
🟡 B / C	Neutral
🟠 D / E	Emerging discount
🔴 F / G	-10–30% brown discount

👉 Energy is now a **valuation driver**, not just a technical detail.

3 The Core Problem

Ci / SIR gives:

- ✓ Transaction truth
- ✓ Market averages
- ✓ Price benchmarks

But it does NOT give:

- ✗ Real defect data
- ✗ Structural risk
- ✗ Moisture damage
- ✗ Electrical decay
- ✗ True retrofit CAPEX
- ✗ Simplex legal verification

So:

📌 SIR tells you what a property “should be worth.”

📌 It does NOT tell you what it is actually worth.

That is the intelligence gap.

4 Your Strategic Pivot – InspectOS = Ground-Truth Layer

Your supervisor said:

| “Go full force on InspectOS.”

This is the strategic move.

You are creating a **Truth Layer**.

What is Ground-Truth?

Ground-truth means:

Real inspection data

Real structural scoring

Real energy upgrade cost

Real legal verification

Instead of:

“Year built = proxy for condition”

You use:

✓ Structural integrity score

✓ Moisture detection

✓ Remaining lifecycle of systems

✓ Quantified energy retrofit cost

5 Asset Integrity Correction Factor (AICF)

This is critical.

You take:

 SIR baseline value (e.g., €5,000/m²)

Then subtract:

 Immediate CAPEX (e.g., €40,000 structural fix)

 Energy upgrade cost

 Legal risk adjustment

Result:

 True Net Investment Value

This adjustment = **AICF (Asset Integrity Correction Factor)**.

It corrects overpricing.

6 Predictive Off-Market Sourcing Strategy

High-alpha investors do NOT wait for Idealista listings.

They monitor:

- 🔪 IMI 6x tax penalties (vacant buildings)
- 🔪 Obras coercivas (municipal forced repairs)
- 🔪 Very low utility consumption
- 🔪 Inherited properties with multiple heirs
- 🔪 Condo arrears

This creates:

🔥 Pre-Distress Inventory

You approach sellers BEFORE the market re-prices them.

That captures the delta between:

Neglected value → Rehabilitated value.

7 The Intelligence Flywheel (Your Architecture)

Your strategy has 3 connected parts:

- 1 Predictive Sourcing
- 2 Better Valuation
- 3 Stronger Due Diligence

They reinforce each other.

🔄 How They Connect

Inspection → Better valuation

Better valuation → Smarter sourcing

Sourcing → Off-market advantage

This creates a compounding intelligence moat.

8 Your Main Strategic Suggestion – AIRCS

This is your strongest idea.

🏆 AIRCS = Asset Integrity & Regulatory Compliance Score

Think of it as:

🇪🇺 Credit Score for Buildings

A single 0–100 score.

Structure of AIRCS

📊 40% Transactional Health

- Based on SIR benchmark
- Price momentum

🏠 30% Physical Integrity

- Structural condition
- Moisture risk

– Systems lifecycle

 20% Regulatory Compliance

– Urban title verification

– Simplex audit

– Unauthorized works detection

 10% Energy Resilience

– CAPEX needed to reach EPBD standards

– ROI of retrofit

9 Why AIRCS Is Powerful

For Buyers:

- ✓ Filter properties quickly
- ✓ Reduce due diligence cost
- ✓ Avoid Simplex liability trap

For Sellers:

- ✓ High score = premium positioning
- ✓ “Institutional grade” signal

For Banks:

- ✓ Risk-weighting indicator
 - ✓ ESG monitoring
 - ✓ Portfolio risk control
-

10 The Data Moat

Every inspection:

Adds structured defect data

Improves scoring accuracy

Increases predictive power

Over time:

AIRCS becomes infrastructure.

That is your moat.

1 1 Technical Implementation (Simple Version)

Architecture:

Bronze Layer → Raw feeds

Silver Layer → Cleaned + standardized

Gold Layer → AIRCS + ROI models

Sources:

- SIR / Idealista
- PEPU permits

- Municipal bulletins
- INE statistics
- Sentinel imagery
- InspectOS inspections

Stack:

Postgres + PostGIS

Lakehouse architecture

API layer for banks

Foreign Buyer Strategy

Foreign HNWIs face:

- ✗ Language barriers
- ✗ Legal complexity
- ✗ Simplex risk

You solve with:

- ✓ English reports
- ✓ Transparent scoring
- ✓ "Certified Pre-Valuation"
- ✓ Retainer + success model

High-tech + high-touch.

Strategic Summary

Portugal now has:

Transaction transparency

But legal and physical uncertainty

Your strategy:

Combine SIR + InspectOS + PEPU

Create AIRCS

Capture off-market distress

Correct valuations with AICF

Position Fairbank Intel as:

- 🚩 The Asset Truth Infrastructure of Portugal
-

Fairbank Intel Strategy & Roadmap (Short Report)

Goal (one line): Build Portugal's leading buyer-side platform that merges transaction data (SIR) with on-site inspections and permit intelligence to deliver the **AIRCS** (Asset Integrity & Regulatory Compliance Score) and a predictive off-market sourcing engine.

1. Value proposition (why this matters)

- **Fix the gap:** Transaction truth (SIR) $\neq$ Asset truth (physical + legal).
 - **Protect buyers:** Reduce overpayment, prevent “Simplex” liabilities, quantify retrofit costs (EPBD).
 - **Create a moat:** Proprietary inspection data + permit scraping + renovation-cost dataset → licensable AIRCS API for banks, marketplaces, and advisors.
-

2. Elevator pitch (30s)

We combine licensed transaction feeds (SIR), municipal permit streams (PEPU) and professional inspections (InspectOS) into a single, auditable **AIRCS** score and a predictive sourcing feed. That score prevents overpayment, unlocks off-market deals, and becomes the risk-control metric banks and investors pay for.

3. Where to begin — immediate actions (Day 0)

1. **Approve 90-day pilot** and small budget (see budget section).
 2. **Secure trial data access:** request trial SIR / Idealista / CASAFARI feeds.
 3. **Enable PEPU ingestion:** set up API polling for municipal permits.
 4. **Create minimum InspectOS inspection template** (moisture, structure, MEP, EPC inputs).
 5. **Assemble pilot team** (2 data engineers, 1 ML engineer, 1 PM, 2 certified inspectors, 1 legal advisor).
 6. **Define success metrics** (KPIs listed below).
-

4. 90-Day Roadmap (practical, deliverable-driven)

Days 0–30 — Foundations (deliverables)

- Ingest trial transaction feed (SIR or fallback).
- Connect PEPU API & municipal bulletin scrapers.
- Launch InspectOS minimum inspection flow; run 10 sample inspections.
- Set up lakehouse Bronze → Silver pipeline.

Deliverables: Data pipeline up; first 10 inspection records; project dashboard.

Days 31–60 — Prototype (deliverables)

- Build AICF calculation prototype and prototype **AIRCS** weights.
- Compute AIRCS for 50 sample properties (mix of Lisbon + Porto).
- Produce first “Certified Pre-Valuation” report template for off-market outreach.

Deliverables: 50 AIRCS scores; sample pre-valuation report; pilot analytics.

Days 61–90 — Pilot & Partnering (deliverables)

- Launch top-100 predictive sourcing watchlist.
- Pilot AIRCS API with internal risk desk or single bank partner.
- Run commercial talks for production SIR license.

Deliverables: Predictive watchlist; bank pilot integration; SIR license LOI or negotiation started.

5. 180-Day (scale & monetize)

- Expand inspections to 200+ properties.
- Offer public “AIRCS-verified” listings pilot for agents / sellers.

- Launch subscription MVP (Explorer / Professional tiers) + AIRCS API commercial offer for banks.
 - Start revenue pilots: inspection fees, advisory retainer, API license.
-

6. Tactical requirements (people, tech, data, legal)

People (initial team)

- 1 Product Manager (PM)
- 2 Data Engineers (pipeline + lakehouse)
- 1 ML / Data Scientist (AVM + AIRCS)
- 2 Certified Inspectors (field)
- 1 Legal advisor (Simplex/EPBD/GDPR)
- 1 Sales/Partnership lead (bank / Ci negotiations)

Tech & stack

- Lakehouse (Bronze / Silver / Gold)
- Postgres + PostGIS; object store; Dagster orchestration; dbt; FastAPI; React/Next frontend; MapLibre maps.
- Inspector mobile app (InspectOS) + image/photo evidence storage.

Data

- Licensed: Confidencial Imobiliário (SIR) preferred; fallback: Idealista / CASAFARI.
- Public: PEPU (permits), INE, municipal bulletins, Sentinel imagery.
- Proprietary: Renovation cost inputs, condition scores.

Legal / Compliance

- GDPR-approved ingestion & storage, E&O disclaimers for reports, inspector certification agreements.
-

7. KPIs (measure success)

- Data & coverage: number of inspections completed (target 50 → 200 → 1,000)
 - AIRCS coverage: % of target city properties with score (target 1% → 10% → 25%)
 - Predictive sourcing success: % of watchlist converted to contact / LOI (target 5–10%)
 - Time-to-AIRCS for a property (target <48 hours after inspection data)
 - Partner traction: 1 bank pilot + 3 advisory clients within 90 days
 - Revenue signals: inspection fee revenue, API pilot fee, advisory retainer wins
-

8. Simple budget sketch (90-day MVP) — rough ranges

- Data trial / SIR negotiation: €5k–€30k (trial vs license)
 - Team (90 days salaries + contractors): €70k–€120k
 - Infra & tooling (MVP cloud + storage): €3k–€8k
 - Inspectors & field costs (travel, reports): €8k–€20k
 - Legal / compliance: €3k–€8k
- Estimated 90-day pilot total: €90k–€200k** (adjust with exact salary/contractor rates).
-

9. Risks & mitigations (concise)

- **SIR dependency** → Build fallback ingestion (Idealista/CASAFARI); productize AIRCS as added value to SIR.
 - **Inspection liability** → Deliver factual reports + cost ranges; include legal disclaimers; maintain E&O coverage.
 - **Data quality** → Inspector training, photo evidence, QA audits.
 - **Regulatory changes** → Keep modular AIRCS weights; retain legal counsel; continuous PEPU monitoring.
-

10. Immediate ask (what I need from the boss)

1. Approve **90-day pilot budget** (range: €90k–€200k).
 2. Permission to start commercial talks with **SIR / Confidencial Imobiliário** and PEPU access.
 3. Approve hiring/contracting of initial pilot team (PM + 2 engineers + 2 inspectors + legal).
 4. Intro to one internal lending partner or risk desk for pilot integration.
-

11. One-page deliverable list (what we produce in 90 days)

- Data pipeline ingesting SIR/PEPU.
 - InspectOS minimum inspection template + 50 inspections.
 - 50 prototype AIRCS scores + 10 Certified Pre-Valuation reports.
 - Predictive top-100 watchlist.
 - Bank pilot: AIRCS API integration proof-of-concept.
-

- Confidencial Imobiliário (Ci) / SIR
 - CM Valuation Model
 - InspectOS
 - PEPU
 - EPBD
 - Simplex Urbanístico
 - Predictive Sourcing
 - AICF
 - AIRCS
 - AVM
 - Due Diligence
 - VPT
 - IMI
 - Obras Coercivas
 - Devoluto
 - RNAL
 - Condo Health / Reserve Fund
-

1 Confidencial Imobiliário (Ci)

What it is:

A Portuguese company that collects and analyzes **real transaction prices** in the housing market.

Why it matters:

- It is the **main data provider** for banks and institutions.
- Around **90% of institutional valuations rely on it**.
- It runs the system called **SIR**.

Strategic meaning:

It controls the **"transaction truth"** of the market.

But it does NOT control the **physical truth** of each property.

That is your opportunity.

2 SIR (Residential Information System)

What it is:

Ci's main database.

It tracks:

- Asking price
- Final selling price
- Time on market
- Negotiation difference
- Postcode-level averages

Why it matters:

It is the backbone of:

- Mortgage valuations
- Bank risk models
- Institutional investment decisions

Limitation:

It works with averages and proxies.

It does NOT:

- Inspect buildings
 - Detect structural damage
 - Calculate retrofit costs
-

3 CM Valuation Model

CM refers to Confidencial Imobiliário's pricing methodology.

What it does:

Uses econometric models to estimate:

- Market value per m²

- Absorption time
- Market trends

Weakness:

It assumes:

- "Average condition"
- "Normal compliance"
- "No hidden defects"

It is **condition-blind**.

InspectOS

What it is:

Your physical inspection intelligence system.

It collects:

- Structural condition
- Moisture detection
- Electrical systems condition
- Plumbing lifecycle
- Energy upgrade feasibility
- Compliance verification

Strategic role:

It creates the missing **ground-truth layer**.

Instead of guessing condition, you measure it.

This converts:

"Year built" → Into → "Remaining system lifecycle"

That is a huge upgrade in valuation accuracy.

PEPU

Full name:

Electronic Platform for Urban Planning Procedures.

What it is:

A national digital platform that centralizes:

- Building permits
- Construction approvals
- Project status
- Municipal deadlines

Starting 2026, all municipalities must use it.

Why it matters:

For the first time, urban planning data becomes:

- Centralized
- Machine-readable
- API-accessible

Strategic use:

You can:

- Verify legal status automatically
- Detect tacit approvals
- Track permit delays
- Monitor new construction pipelines

PEPU gives you regulatory intelligence.

6 EPBD (Energy Performance of Buildings Directive)

What it is:

European regulation requiring:

- Energy transparency
- Minimum energy standards
- Mandatory upgrades for inefficient buildings

Why it matters:

Energy rating now affects:

- Market price
- Mortgage rate
- Liquidity
- Long-term asset viability

Strategic opportunity:

You calculate:

- Retrofit CAPEX
- ROI of solar panels
- Insulation payback

You turn energy into an investment variable.

7 Simplex Urbanístico (Decree-Law 10/2024)

What it did:

Reduced bureaucracy in construction.

Removed:

- Mandatory presentation of usage permit at sale

What changed:

Buyers are now responsible for verifying legality.

Risk created:

A buyer may:

- Buy illegal construction
- Inherit demolition risk
- Face mortgage rejection

Strategic impact:

Demand for independent verification increases massively.

That is where InspectOS becomes essential.

8 Predictive Sourcing

What it is:

Finding properties BEFORE they go on the market.

How:

By detecting distress signals:

- IMI tax increase (vacancy penalty)
- Obras coercivas
- Low utility usage
- Probate cases
- Condo arrears

Why it matters:

You capture value before re-pricing happens.

This is alpha generation.

9 AICF (Asset Integrity Correction Factor)

What it is:

A mathematical adjustment to SIR valuation.

Example:

SIR says property = €500,000

Inspection reveals €40,000 structural issues

Energy upgrade = €25,000

AICF adjusts value downward accordingly.

Purpose:

Convert market value → into → true investment value.

10 AIRCS (Asset Integrity & Regulatory Compliance Score)

What it is:

Your main strategic product.

A 0–100 score that measures:

- Market health
- Physical condition
- Legal compliance
- Energy resilience

Think of it as:

Credit score for buildings.

Why it wins:

Banks understand scoring systems.

Investors understand scoring systems.

It simplifies complexity into one number.

11 AVM (Automated Valuation Model)

What it is:

An algorithm that estimates property value automatically.

Most AVMs:

- Use transaction data
- Ignore condition

Your upgrade:

AVM + AICF + AIRCS = smarter valuation.

12 Due Diligence

Meaning:

The investigation before buying property.

Includes:

- Legal verification
- Structural inspection
- Financial analysis
- Permit check

After Simplex, due diligence is more critical than ever.

13 VPT (Valor Patrimonial Tributário)

What it is:

The tax-assessed value of a property.

Used to calculate IMI.

If VPT updates suddenly, taxes increase.

You can detect financial pressure through this.

1 4 IMI

What it is:

Portuguese property tax.

If property is vacant > 2 years:

IMI can increase 6x–12x.

This creates forced sellers.

1 5 Obras Coercivas

Meaning:

Municipality forces repairs on abandoned buildings.

City repairs building and sends bill to owner.

Strong distress indicator.

1 6 Devoluto

Meaning:

Officially classified vacant property.

Detected via:

- Very low electricity consumption
- Very low water usage

These are prime sourcing targets.

1 7 RNAL

National registry for short-term rentals (Airbnb).

If AL license is cancelled:

Investor income drops.

Possible forced sale.

1 8 Condominium Health / Reserve Fund

What it is:

The financial condition of the building's shared budget.

If:

- Many owners not paying

- Reserve fund empty

Then:

Future special repair payments will be required.

Another distress signal.

Big Strategic Picture

You are building:

Layer 1 → Transaction Truth (Ci/SIR)

Layer 2 → Regulatory Truth (PEPU + Simplex verification)

Layer 3 → Physical Truth (InspectOS inspections)

Layer 4 → Energy Future Truth (EPBD retrofit modeling)

Then you combine them into:

AIRCS + Predictive Sourcing Engine.

That is infrastructure-level thinking.
