

AURA V5 — Real Estate Intelligence Data Report

1. System Overview

AURA V5 is a multi-layer spatio-temporal real estate intelligence system designed to model property valuation using spatial, temporal, macroeconomic, and behavioral signals.

2. Dataset Summary

Rows: 1,252,804

Columns: 174

Time Range: 2019–2025

Granularity: grid_id_250m × year × quarter

3. Spatial Intelligence (Cat5 & Cat8)

Cat5 captures urban morphology such as density and infrastructure. Cat8 captures accessibility and desirability through points of interest and distance metrics.

4. Target Layer (Cat7)

The target variable is price_per_m2 with 100% coverage and no missing values, ensuring high-quality supervised learning.

5. Market & Macro Layers (Cat2 & Cat3)

These layers capture market trends (HPI, liquidity) and macroeconomic conditions such as inflation and economic regimes.

6. Socioeconomic Layer (Cat4)

Includes population, demographics, and housing supply factors influencing demand.

7. Behavioral Layer (Cat6)

Captures real-world behavior including tourism pressure, demand intensity, and regulatory signals.

8. Micro Market Signals (Cat1_2)

Includes momentum, volatility, and short-term price dynamics derived from market activity.

9. Data Quality

Missing Values: 0%

Duplicates: 0

Infinite Values: 0

Fully production-grade clean dataset.

10. System Strengths

Multi-layer intelligence, strong spatial-temporal alignment, zero data leakage, and scalable architecture.

11. Limitations

Partial municipality alignment and absence of transaction-level granularity.

12. Final Verdict

AURA V5 is a production-ready real estate intelligence infrastructure suitable for advanced machine learning and decision systems.
